

## Tree Inventory and Assessment

Tree inventory and assessment is a critical component to any tree, landscape, or campus management plan. It is an essential first step for construction-related tree preservation planning. Knowing the types of trees you have and their condition is the basis to any successful program.

The Care of Trees offers full range of inventory services – from simple tree identification and tagging, to complex GPS tree location mapping and associated GIS or CAD integration. Every client has a specific need and we design each inventory to meet their specific objectives and to fit their budget.

Field work for each inventory is performed by one of our ISA Certified Arborists®. When appropriate, our arborist assessments are performed using the International Society of Arboriculture’s Condition Assessment format. This provides both an industry standard format and a level of investigation that identifies most observable problems.

As with all our work, our consulting staff of professional foresters, arborists, and horticulturalists are available to review each inventory or assessment as necessary.

(top to bottom) A technician begins the GPS tree location mapping process; the tree is mapped; this tree has been identified and tagged by an ISA Certified Arborist®.
